

Maximize the Value of Your Investment

Grid Bracer™

The AutoStore™ Grid Bracer™ is a steel cross-bracing system that can be added to the AutoStore Double/Double Grid to provide operational support for all sizes of AutoStore systems.

The Grid Bracer allows you to get the most out of your storage space by eliminating the need to anchor the Grid around the pillars or walls, making the Grid self-supporting. Creating a Grid that stands on its own will reduce system installation time and costs significantly – maximizing the value of your investment.

Key Benefits

- **Faster and cost-efficient system turnaround:** As there is no need to wait for additional structural construction documents to be approved, Grid Bracer allows you to start Grid construction earlier compared to the traditional Grid. You also avoid the hassle and cost of having to supply technical information about the construction of the warehouse.
- **Increased storage density:** You can store more products (vs. Grids with additional pillars or wall attachments) as Grid Bracers do not occupy additional cells in the Grid. This allows you to use your storage space to its full potential while ensuring smooth AutoStore system operations.
