Connecting Your Data Dots
to Boost Your System Performance

Unify Analytics™

Having a full overview of your AutoStore™ system at all times is essential to accelerating business growth.
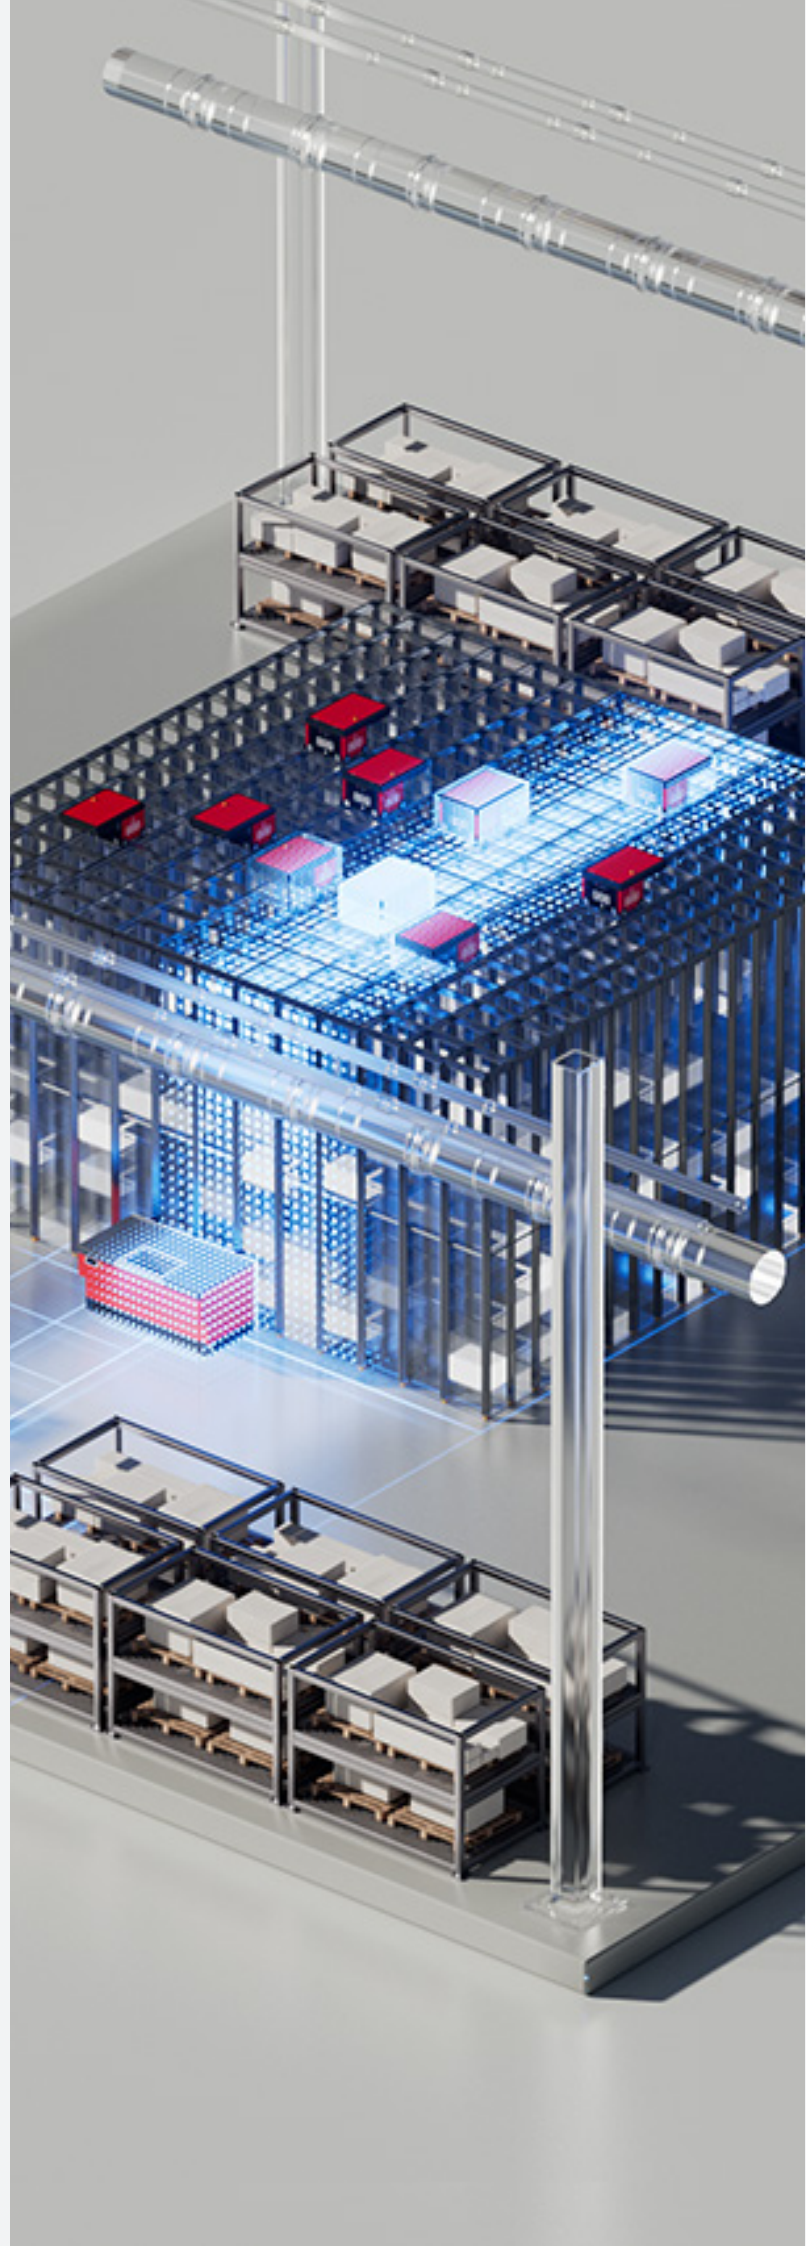

Unify Analytics™ is a cloud-based service and data platform that automates the traditional way of collecting and analyzing real-time log data. By automating the process, you get faster and deeper actionable insight and trends from your AutoStore system, allowing you to reduce wasted time, eliminate human error, optimize their system performance, and fuel business growth.

Unify Analytics' state-of-the-art cluster technology gives you a full overview of your system status, module performance reports, and graphical presentation of data trends to help you make informed decisions about your systems and take proactive action.

Unify Analytics is available in two versions:
Web application and **API**

- **Web application:** Easy and intuitive out-of-the-box web application for viewing real-time statistics and analytics of your AutoStore systems

- **API:** Allows access to raw real-time AutoStore log data and enables seamless integration with any external third-party application of the customers' choice.

Product Features & Functionality

- **Performance analysis dashboard:** Intuitive graphic representation of metrics, statistics, and analytics portraying module operational trends (e.g., module operational status and Bin fill rate), helping you take prompt action. This allows you to be proactive by preventing problems before they happen.

- **Reporting:** Provides key operational data reports (e.g., picking productivity and system uptime) you can act upon immediately.

New features are being developed continuously and will be added to the platform gradually.

Key Benefits

- **Easy access to system performance against KPIs:** With more accessible AutoStore system performance data, you can now more quickly and easily identify the root cause of operational bottlenecks and optimize your systems to maximize business performance – accelerating business growth and helping you stay ahead in the market.

- **Improves system transparency & accountability:** You get a complete overview of the live and logged data from their AutoStore system via the user interface, and analytics from other applications in the warehouse (if integrated using the API). This allows you to have concrete goals, accurate measurements of the results, and efficient management of data.

- **Facilitates data-driven decisions:** Automated analytics and statistics provide deeper insight into their AutoStore system, enabling you to make data-driven business decisions to continuously improve your business and increase decision-making confidence and speed.
